Intro

This document describes one approach for an PROD DATB PTR App. This app should provide dedicated content for PTAs and professionals.

The access to the application should be granted via a central password which can be edited in the back end.

System requirements

iPad with iOS 8.0 or later.

Smartphones (iPhones and devices with Android).

Although the requirements are based on the iPad structure, they can be adapted to all smartphones as well.

Backend-Concept

To build a strong backend for the PROD DATB PTA App, we suggest to use a LAMP environment. Linux Debian 7, Apache2, MySQL, PHP5.

The base system should be handbuild via Laravel, a PHP framework based on Symfony 2. Recommended database is mysql with UTF8 encoding and at least indexes on the unique id columns. We should add a timestamp of creation and change of each entry. In case of research we can refer to timestamp of creation date.

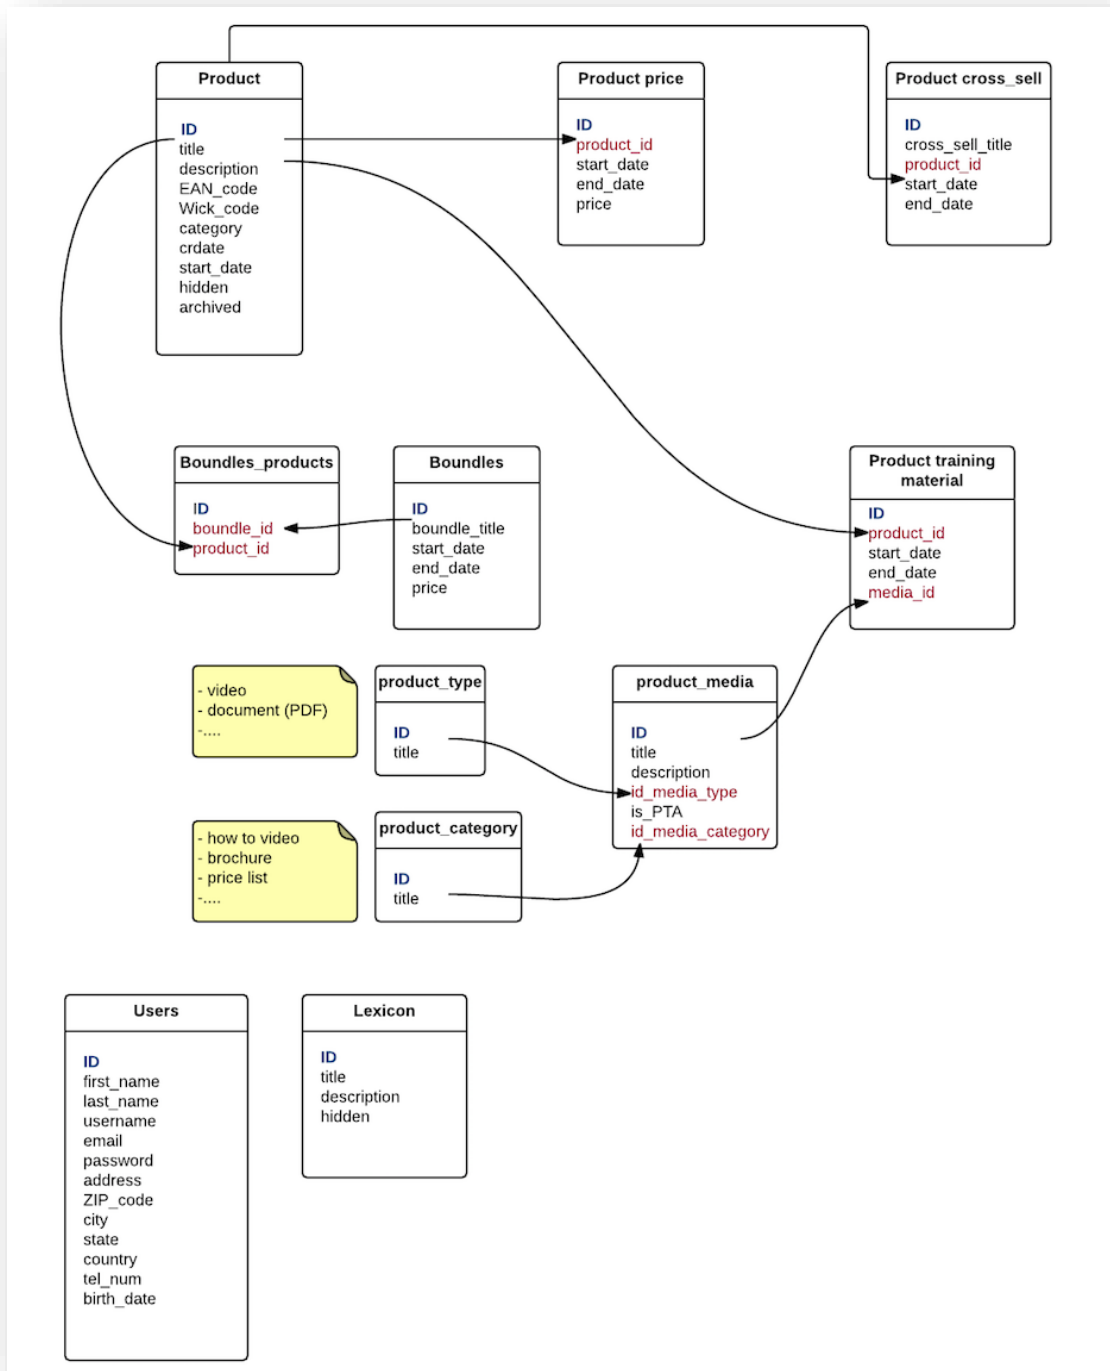

For the following pages is a connection to the backend mandatory:

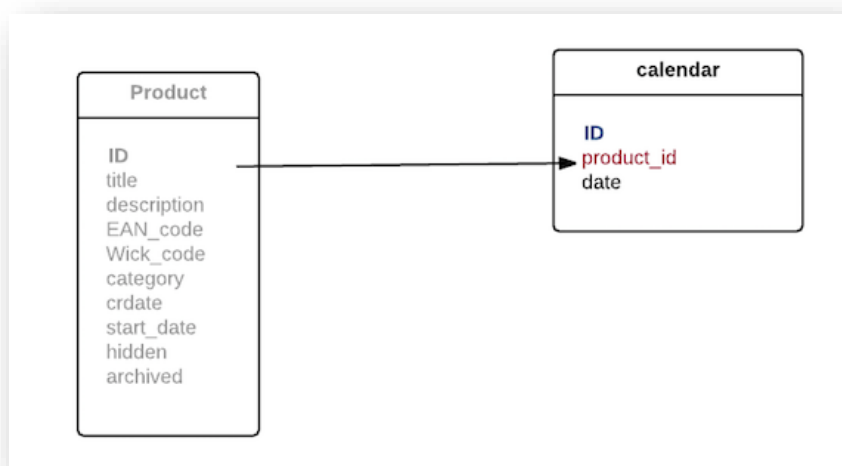

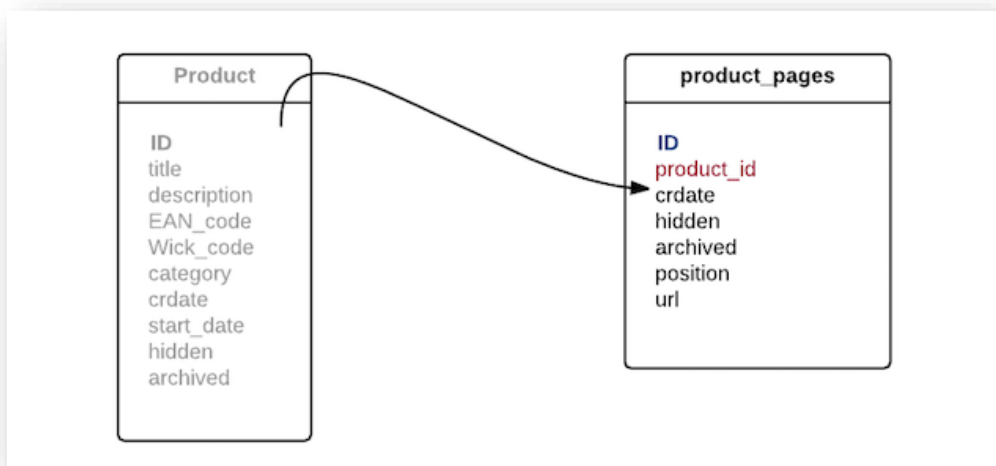

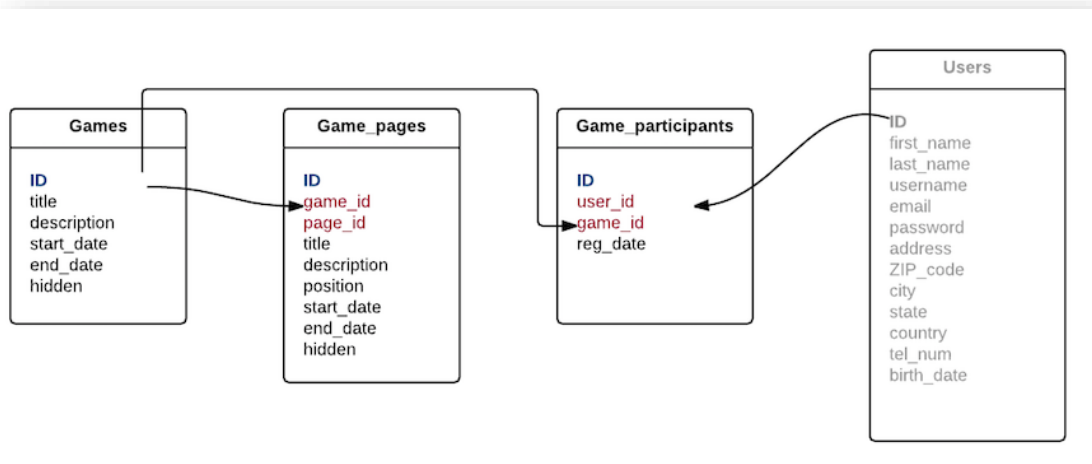

- cross-selling/recommendation algorithm: To update current cross selling offers
- lexicon/glossary: to maintain the list of available glossary items
- cold season calendar: to update the necessary dates
- profit calculator: to update the calculation formulas
- service chat via instant messenger with key account: to server the communication master
- push messages: to edit and schedule the messages
- other areas can be updated via app-update itself - no web connection needed

The interface between App and Web-Application will be in JSON format.

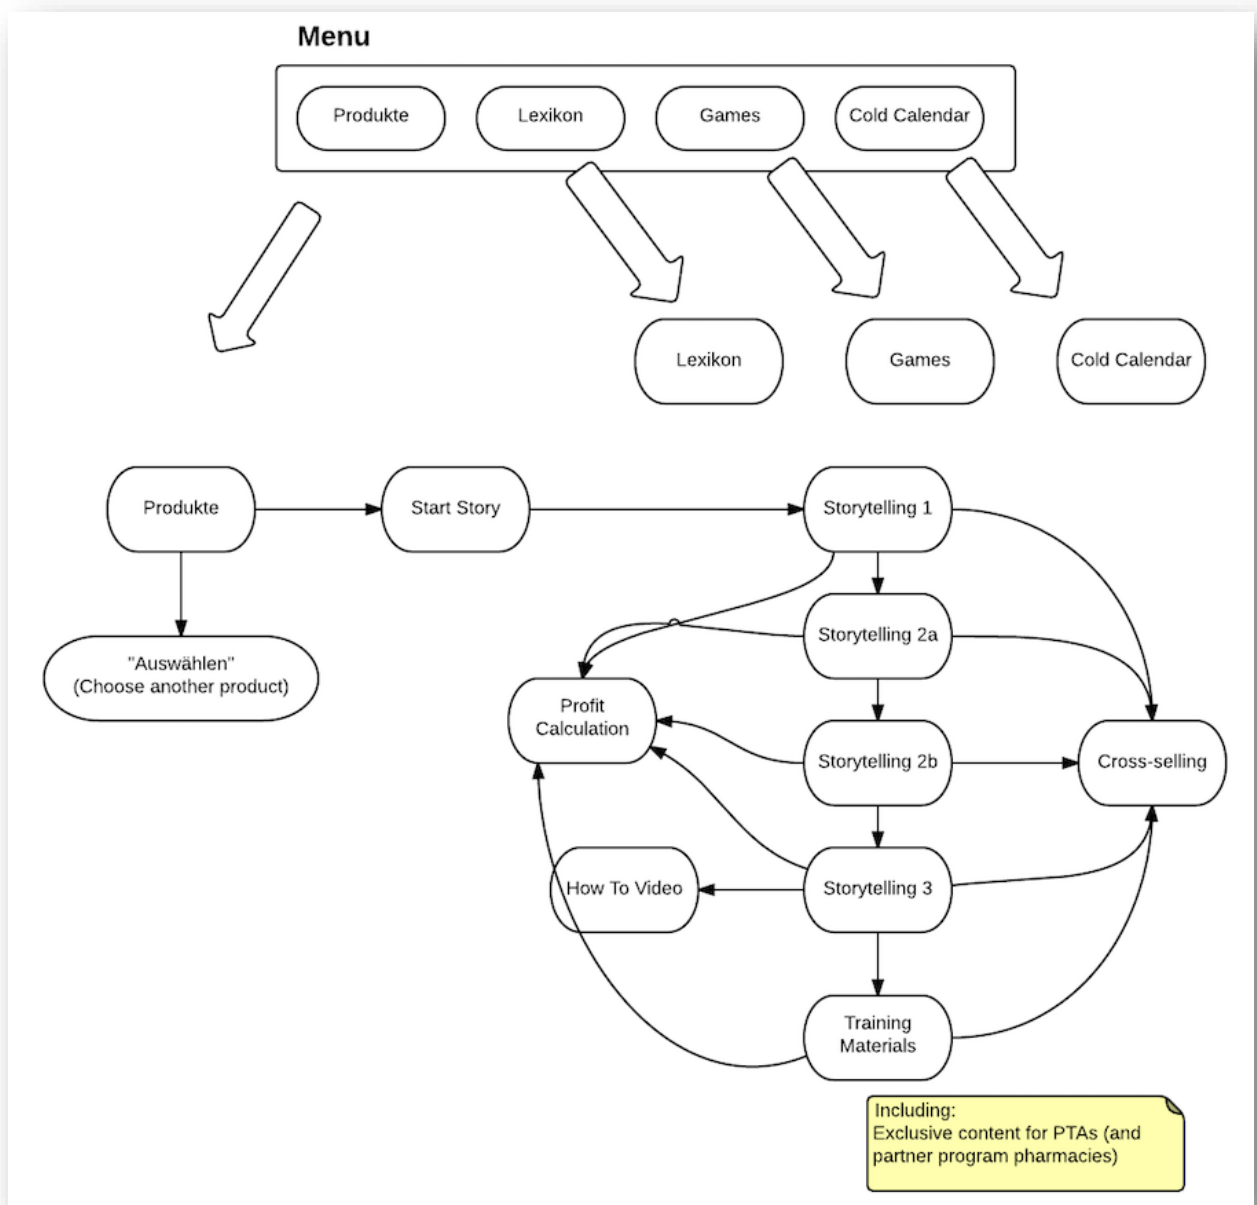

Database structure of App

The database structure should be the following:

Frontend Flow overview:

Ipad

This is the Ipad App Version.

OnPageLoad:

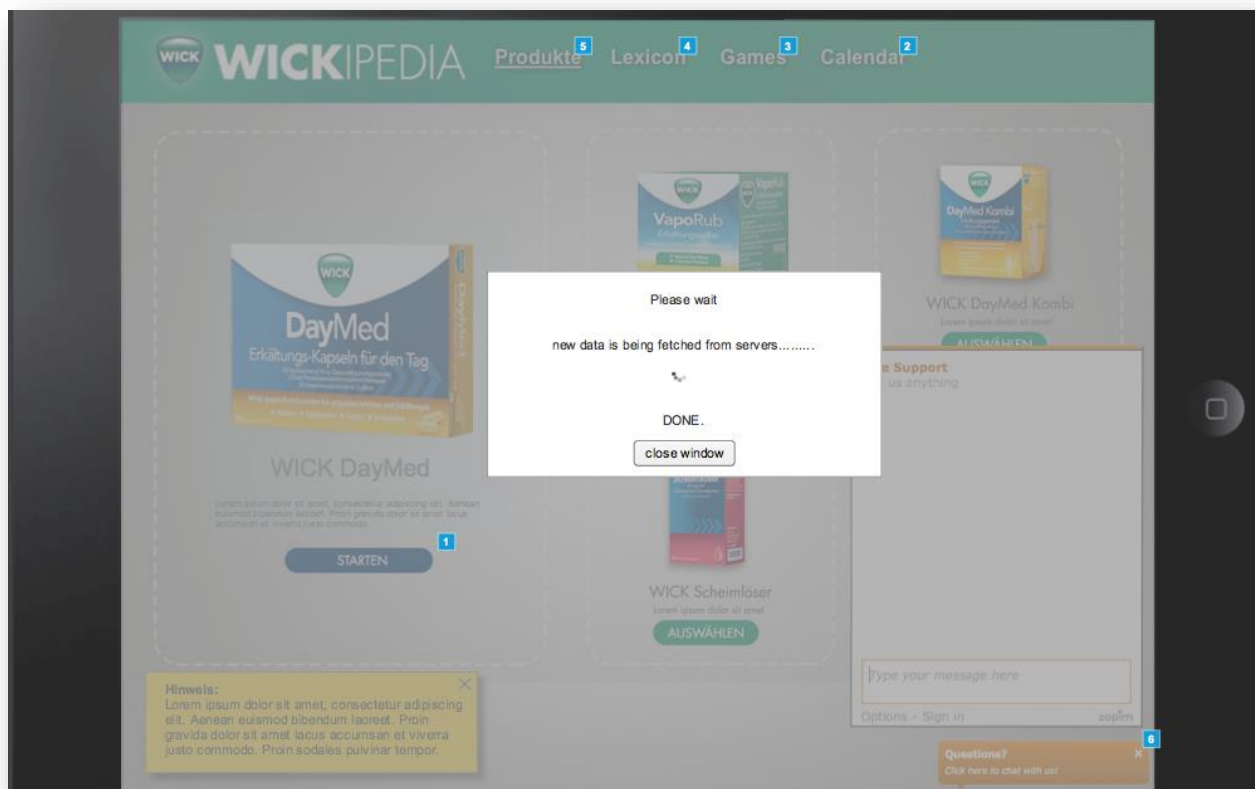

Case 1:

Open Produkte in Current Window

(Produkte is at once the home screen).

On every new load, if web connection is available, the app will try to update itself. During this time, a waiting dialog will occur:

Notice: The name "PROD DATBipedia" is a working title that was used for layout.

Produkte

SCENE

001: INTRODUCTION

ENVIRONMENT

The app is running in a framework with media-adequate interface. The interface contains a large stage where the actual content happens. The interface also contains a couple of global functions, the user can address at will from every point of the application-process.

Those functions should include the following toolbox:

PRODUCT OVERVIEW (PRODUKTE) leading to the a site with an overview of the introduced products

SCENE-CONTROLS on demand you can skip to the former or rather the next scene

LEXICON within the chemically explanations there will occur a lot of terms the audience may not know. Those terms are highlighted. Tipping on them will lead to a brief lexicon.

GAME/RAFFLE leading to a sub-page containing a few multiple-choice questions to the storytelling-modules.

COLD Calendar: leading to a sub-page containing a calendar with seasonal health advice, i.e. for each day showing which products and/or recommendations to choose/follow.

SCENE DESCRIPTION

In this very first scene you have to decide, which product to explore first. The available products are arranged on the stage and labeled with their names. Tipping on the item enlarges the chosen product and provides a box with additional content such as product description

INTERACTION

The user can choose one of several products (no limit).

In the page the selected product will be displayed on the left side including a middle size product image, the product title and the product description.

On the left side 4 other products will be displayed, including small size product image, product title, short product description, "Auswählen" (Choose) green button. By swiping on this side of the display the list of products will be updated showing the next 4 products in the list of available products. The list of products is unlimited.

In our example the choice is between the following products:

PROD DATB VapoRub

PROD DATB MediNait

PROD DATB DayMed

PROD DATB DayMed Kombi (Hot Drink)

PROD DATB Husten-Sirup

As he does, the referred storytelling-module is initialized immediately.

CHAT

In every page it is possible to contact an assistant via chat.

By clicking over the chat balloon the chat panel will be displayed and ready for the chat.

SEASONAL TIPS VIA PUSH MESSAGES

When available messages/info will be displayed in form of push messages

Storytelling 1

SCENE

002: STORYTELLING-MODULE I (VAPORUB)

ENVIRONMENT

As soon as the storytelling-module is initialized, an additional panel appears above the scene-controls. In this panel the user can track the progress of the storytelling. In this scene the storytelling-panel indicates the user finds himself in the first phase. To make sure the user knows what to do next, the panel shows an icon with a finger tipping on the product-tin.

Additionally there can appear the headline, giving an order for action. In every scene the panel gives feedback on how many scenes will follow until the storytelling-module is completed.

SCENE DESCRIPTION

As soon as the storytelling-module is initialized, the chosen product moves to the right-lower corner of the stage. The odd products disappear. In the middle of the stage a stylized picture of a proband appears. The proband is preferably female and shown from nose to breast. The proband wears a dimly top so that no bad association may appear. The proband has a transparent throat, showing an inflammation. The nose is transparent too, disclosing blocked sinuses and a starting inflammation.

INTERACTION

The user receives an order for action. He tips on the product and as he does, a transparent blue shape sticks to the cursor. The transparent blue shape is to symbolize the lotion. The user is asked to apply the lotion on the proband. While doing so, more and more lotion sticks on the proband. The more lotion sticks on the proband, the less transparency is left. Technically this is an advanced version of a drag-and-drop task.

BOTTOM MENU

In each page the user can decide to go to one of the modules relative to that product: cross-selling recommendations, how-to-video, and training materials.

“How-to-video” will be shown in the same page on an overlay.

User Interface

Storytelling 2 a

SCENE

003: STORYTELLING-MODULE II (VAPORUB)

ENVIRONMENT

In this scene the storytelling-panel indicates the user finds himself in the second phase. The front part of the panel is labeled with the first-scene and check-marked. The current part of the storytelling-panel contains an icon with an eye and asks the user to watch the transformation.

SCENE DESCRIPTION

The previous scene is continued gluelessly. The product in the lower-left corner is still present but it isn't active anymore. The proband is covered with the lotion. The lotion becomes transparent and the illustration of the effectiveness starts.

INTERACTION

Whenever the effectiveness turns into another phase a dialogue-box occurs. The dialogue-box contains a brief explanation of what the user just observed. The user has to confirm each dialogue-box to initialize the next phase.

13			In every page it is possible to contact an assistant via chat.

dynp_video

same as on page 18

Storytelling 3

SCENE

004: STORYTELLING-MODULE III (VAPORUB)

ENVIRONMENT

In this scene the storytelling-panel indicates the user finds himself in the third and last phase. The front part of the panel is labeled with the two former scenes. Both are check-marked. The current part of the storytelling-panel contains an icon with a mark of exclamation. The user receives a brief summary of what he has learned.

SCENE DESCRIPTION

The previous scene is continued guilelessly. The product in the lower-left corner is still present but it isn't active anymore. The proband is covered with the lotion. The lotion becomes transparent and the illustration of the effectiveness starts.

INTERACTION

Whenever the effectiveness turns into another phase a dialogue-box occurs. The dialogue-box contains a brief explanation of what the user just observed. The user has to confirm each dialogue-box to initialize the next phase. Though you can initialize the GAME/RAFFLE from every step in the application, in this scene there's a huge call-to-action to attend it.

Chat-Interface:

To build a communication channel from PTA to KAM an instant messaging / callback feature should be integrated. This needs two functionalities:

- 1) a notification panel on key account managers desktop (an website). It will send an email to specified KAM and triggers him if a request is send
- 2) a request for chat button inside of the app

Process as follows:

Navigation

This is the Ipad Navigation Bar.
